
Root Canal

Once upon a time, if you had a tooth with a diseased nerve, you'd probably lose that tooth. Today, with a special dental procedure called a root canal therapy you may save that tooth. Inside each tooth is the pulp which provides nutrients and nerves to the tooth, it runs like a thread down through the root. When the pulp is diseased or injured, the pulp tissue dies. If you don't remove it, your tooth gets infected and you could lose it. After Dr. Rice removes the pulp, the root canal is cleaned and sealed off to protect it. Then he places a crown over the tooth to help make it stronger.

Most of the time, a root canal is a relatively simple procedure with little or no discomfort involving two visits. Best of all, it can save your tooth and your smile!
